Sendix F3653 / F3673 (Shaft / Hollow shaft)

SSI / BiSS-C

The Sendix F36 singleturn with the patented Intelligent Scan Technology™ and SSI or BiSS-C interface boasts exceptional ruggedness and compact dimensions.

With a size of just 36 x 42 mm it offers a through hollow shaft of up to 8 mm or a blind hollow shaft of up to 10 mm. Its high-precision optical sensor technology can achieve a resolution of up to 17 bits.

Reliable and magnetically insensitive

- Sturdy bearing construction in Safety-Lock™ Design for resistance against vibration and installation errors
- Ideal for use outdoors thanks to IP67 protection and wide temperature range from -40°C up to +90°C
- Patented Intelligent Scan Technology™ with all singleturn and multiturn functions on one single OptoASIC - offering highest reliability, a high resolution up to 17 bits and 100% magnetic field insensitivity

Optimised performance

- High-precision with a data refresh rate of the position value ≤ 1µs
- High-resolution feedback in real-time via incremental outputs SinCos and RS422
- Short control cycles, clock rate with SSI up to 2 MHz / with BiSS-C up to 10 MHz

Input current	< 0.5 mA	
Min. pulse duration (SET)	10 ms	
Input delay	1 ms	
New position data readable after	1 ms	
Internal processing time	200 ms	

The encoder can be set to zero at any position by means of a HIGH signal on the SET input. Other preset values can be factory-programmed. The SET input has a signal processing time of approx. 1 ms, after which the new position data can be read via SSI or BiSS-C. Once the SET function has been triggered, the encoder requires an internal processing time of typ. 200 ms; during this time the power supply must not be switched off. The SET function should be carried out whilst the encoder is at rest.

DIR input	
A HIGH signal switches the direction of rotation from the default CW to CCW. This inverted function can also be factory-programmed. If DIR is changed when the device is already switched on, then this will be interpreted as an error. The status output will switch to LOW.	
Response time (DIR input)	1 ms

Status output		
Output driver	Open Collector, internal pull up resistor 22 kOhm	
Permissible load	max. 20 mA	
Signal level	HIGH	+V
	LOW	< 1 V
Active	LOW	
The status output serves to display various alarm or error messages. In normal operation the status output is HIGH (Open Collector with int. pull-up 22 kOhm).		
An active status output (LOW) displays:		
LED fault (failure or ageing) – over-temperature – undervoltage		
In the SSI mode, the fault indication can only be reset by switching off the power supply to the device.		

Power ON	
After Power-ON the device requires a time of approx. 150 ms before valid data can be read.	
Hot plugging of the encoder should be avoided.	

1) Short circuit proof to 0 V or to output when power supply correctly applied
